

Basic Workflow Guide

Use the Session 01 sample to safely try PDF annotations, note editing, saving, and output.

1. Choose a root folder

Choose this sample folder, or a writable copy of it, through File > Choose Root Folder... .

Session 01 opens one practice PDF and its companion note.

2. Edit the PDF and note

Add a small highlight, note, or drawing to the PDF. Open the companion note and edit a heading or checklist item.

Annotation data is stored as same-named .clrop JSON beside the PDF, separate from the original PDF.

3. Save your work

Use Save > Save Work to integrate PDF and note changes into their originals.

Use Save > Review Unintegrated Changes to inspect work that has not yet been integrated.

4. Create a separate output

Use Output > Quick PDF to create an annotated PDF quickly.

Use Output > Output Dialog... to choose a format, page range, or text output. Output never overwrites the original sample PDF.

You may edit this sample freely. Copy the entire root folder first if you want to preserve its original state. Do not remove or move __resource__; it holds local recovery data.
